Beringia Through the Myco-Scope: History, Mushrooms, and Cross-Cultural Encounters

Abstract:

Separated by the two national borders and the international dateline, the Native communities living in the Bering Strait areaf Alaska and Chukotka in the Russian Far East share common histories, physical environments, and subsistediet, that includes that and sea mammal meat, fish, birds, berries, and greens. An exception to common array of subsistence foods are the wild mushrooms: in Chukotka mushrooms are admired delicious edibles, while in Alaska they are regarded as disgusting and poison one, and simply avoided by others.

In an attempt to gain a better understanding reasons and meanings surrounding such opposing attitudes to a resource present on the plants of the Bering Strait, I have conducted ethnographic field research in Nome and between areas of Alaska (summer 2001) and the Chukotsky and Providensky regions Chukotka (summer 2001 February-May 2004, August-September 2004). In the course of this investing, I have discovered that until recently, wild mushrooms were equally shunned by the Natisceples living on both Russian and Alaskan sides of the Bering Strait. In Chukotka, must have become a significant part of subsistence diet during the lastity years due to the influence Russians and other Russified newcomers, many of whom were admirers and noisseurs of wild must oms. While working in the Chukotkan communities of Enmelengingran, Sireniki, Provideniya, Novoe Chaplino, Lavrentiya, and Uelen, I have collected tensive interview data on the subject of ethnomycology offered by people of ditionaS(.)]TJ 0.0001 Tc -0.0001 ned0 Td (of Russi0 Td -caskozry
