

ATMOSPHERIC CHEMISTRY

CHEM F406 Overview and Schedule ---- Spring 2017

Instructor	Dr. Jingqiu Mao (Reichardt 188, Akasofu 318, 474-7118, jmao2@alaska.edu)
Office Hours	Tu, Th 11:20A-13:00P and any other time by appointment
Class	Tu, Th, 9:45A-11:15A, REIC 204
Text:	Introduction to Atmospheric Chemistry, Daniel J. Jacob (Available online: http://acmg.seas.harvard.edu/people/faculty/djj/book/index.html)
Supplements	Atmospheric Chemistry and Physics: from Air Pollution to Climate Change, John H. Seinfeld and Spyros N. Pandis, 3rd Edition.

Course Description (from catalog):o.32 167.88 0.599 Dokw 1.8f12 Dok2 Dosp()Tj ETj ET EMC /P <</M
pollutants; study of important impacts to the atmosphere which result from anthropogenic emissions of pollutants, including acid rain, the “greenhouse” effect, urban smog and stratospheric ozone depletion. Special fees apply. Prerequisites/Co-requisite: CHEM 332. Stacked with CHEM F606. (3+0)

Course objectives / Learning Goals:

By the end of the semester, you will have a basic knowledge of:

- The atmospheric chemical composition
- The transformations of these compounds
- The importance of chemicals in the atmosphere for climate, human health, and ecosystem health
- Air pollution and atmospheric removal of pollutants

You will be able to understand the conversations of atmospheric chemists, seminars on atmospheric chemistry, and discussions with fellow students studying atmospheric chemistry. You will also develop skills in higher-order analysis that will assist both in chemistry pursuits and general studies.

Prerequisites:

Because students may come to this class with a variety of backgrounds, I have made accommodations for students who are either from a pure atmospheric or a pure chemistry background. In either case, I

If you feel you have a lack in either (A: Atmospheric structure) or (B: Basic chemical principles), you should attend the tutorial sessions. These sessions will be held during the first three weeks of classes at a time that is convenient for interested students. In addition to these basic topics, we will cover the following topics, but some knowledge in this area would be beneficial:

Chemical equilibrium, Chemical kinetics, Oxidation states, Chemical catalysis, Basic photochemistry

Course Structure

Classroom sessions, held twice a week, discuss theoretical and practical aspects of atmospheric chemistry. The class-time lectures and discussions will follow the course's textbook. Problem sets are assigned every two weeks. The solutions to problem sets are due at the beginning of class on Tuesday. Please begin the problem set early so that you do not have a deadline crunch and are able to ask questions regarding the problems.

Another part of the class is to do a term project using a computer model to explore chemical transformation of atmospheric pollutants. After an introduction period of lectures on the basic concepts, we will meet one-on-one to discuss the design of your project. All students will participate the term project. Undergraduate student can choose to work with any graduate student on their project. Graduate student will give an oral presentation on their project at the end of the semester. The presentation and subsequent discussion will take approximately 20 minutes.

Working in groups:

While working on your solutions to problems, you may work in groups. In fact, working in groups usually results in faster and deeper learning. Whether you work in a group or alone, you **MUST** write up your own solution to the problem. This provision includes computational work; you must write up your own spreadsheet to solve a numerical problem. Copying the solution of another student is not working in a group and will lead to a hole in your understanding that will appear in your exam performance. My advice is to work in groups but don't cheat yourself.

Grading:

This course is graded with letter grades but no +/- grades. This class is a stacked course, meaning that both senior-level undergraduates and graduate students can take the course. Undergraduates taking the course (those taking CHEM F406) will be graded by the following scheme:

Midterm exam	20%
Final exam	30%
Problem sets	40%
Participation in class discussion	10%

Students taking CHEM F406 complete a few fewer problems on the problem sets than the graduate students in addition to not presenting term project in class. However, undergraduate students are expected to do the term project together with graduate students and participate in the in-class discussions of project presentations.

Homework problem sets are due on Tuesdays at the beginning of class. I will give you 5 free late days. You may use these days whenever you want without penalty. If you exhaust these 5 free days, each additional late day is penalized 10% of your grade on that late problem set. If you have to travel for a conference or have another emergency, I will make every reasonable attempt to accommodate these issues as long as you either inform me before a planned absence or immediately after an emergency.

Tentative Grade Scale:

A	90 - 100%
B	80 - 89%
C	70 - 79%
D	60 - 69%

If I find that students are close to a borderline between grades, I may choose to lower the threshold for the higher grade, but I will not raise the thresholds above the scale listed above.

Students with documented disabilities:

Students with documented disabilities who may need reasonable academic accommodations should discuss these with the professor during the first two weeks of class. You will need to provide documentation of your disability to Disability Services in the Center for Health and Counseling, 474-7043, TTY 474-7045
