Thesis:	**A Sounding Rocket Attitude Determination Algorithm Suitable for Implementation Using Low Cost Sensors** First-ever application of the recently developed unscented Kalman filter to the attitude determination of sounding rockets. In conjunction with Gauss-Newton error minimization, this algorithm filters measurements from simulated low-cost sensors

Thesis:	**Life History Patterns of North American Elk: Effects of Population Density on Resource Partitioning, Reproduction and Plant Productivity** Density dependence in elk (*Cervus elaphus*) on reproduction, ecosystem processes and resource partitioning with mule deer (*Odocoileus hemionus*) and cattle was examined. Changes in habitat use by elk and deer in response to cattle indicated competitive displacement. Elk had lower reproduction in the high-density than the low-density population. Density dependence in large herbivores regulates population dynamics and has substantial effects on ecosystem functioning. Major Professor: Dr. R. Terry Bowyer
