

SMAP satellite image: NASA.

Paper, pencil, craft materials (small recycled boxes, cardboard pieces, paperclips, toothpicks, popsicle sticks, straws, cotton balls, yarn, etc. You can use whatever supplies you have!), fastening materials (glue, tape, rubber bands, string, etc.)

Decide what you want your spacecraft to study. Will it take pictures of clouds? Track forest fires? Measure rainfall? Be creative!

Design your spacecraft. Draw a picture of what your spacecraft will look like. It will need these parts:

Studying Earth From Above

NASA is best known for exploring outer space, but it also conducts many missions to investigate Earth from above. Scientists use the information they collect to better understand our changing planet.

Astronauts on the International Space Station use cameras and scientific instruments to take photos and collect data about Earth. They track and measure cloud cover, ocean currents, air pollution, hurricanes, glacier movements, floods, forest fires, wind speed, urban lighting, and more.

The International Space Station orbits about 250 miles (400 km) above the Earth. Its orbit takes it over parts of the planet at different times, allowing it to collect images from many areas at different times of day.

Scientists also use satellites to study Earth. A satellite is a machine launched into space to orbit Earth (or another object in space). There are many satellites looking down on Earth. They fly high in the sky, so they can see large areas of Earth at one time. They take pictures to send back to Earth.

Global Precipitation Measurement mission, NASA/Goddard.

Scientists learn about changing coastlines, ocean currents, air pollution, and more from the images the satellites send back. For example, the Global Precipitation Measurement mission uses satellites to observe where and how much rain and snow fall onto Earth. This helps scientists understand the relationship between rain and snow, weather, and climate.
